# **MIS AND E-BUSINESS**

# Launching a Successful EC Website

# Unit-6: Launching a Successful EC Website

- Planning Online Businesses (Business Plan, The cost-benefit, risk elements of a business case, funding a New Online Business, EC Model selection),
- The process of building a website, basic hierarchical website structure, website hosting and obtaining a domain name (cPanel management, upload EC site to the web Server),
- Web content creation and management: (Web content, Categories and Types of Content, Content Management and Maintenance, Catalog Content and its Management),
- Website design criteria, Site Map and Navigation, Web page layout grid, Colors and Graphics, Website Usability, Performance, Website Promotion, implementation of Payments system, Website Promotion, Search Engine Optimization (SEO).

# **Planning Online Businesses**

Planning an online business is similar to planning for any startup venture in that it centers on a business plan. **Planning online Plan:** 

- A business plan is a written document that identifies a company's goals and outlines how the company intends to achieve those goals and at what cost.
- It includes both strategic elements (e.g., mission statement, business model, value proposition, and competitive positioning statement) and operational elements (e.g., operations plan, financial

statements) of how a new business intends to do business. Medium and large businesses, or those seeking external funding, must have a formal business plan.

- The primary reason an entrepreneur writes a business plan is to use it to acquire funding from a bank, an angel investor, a venture capitalist, or the financial markets.
- Similarly in an existing business, a business case needs to be written for any new large EC project so management can decide whether to fund it.
- A business plan also is important for a new venture as a tool to recruit senior management and to convince business partners to make a commitment to the business.
- A business plan helps ensure a flourishing business by encouraging an entrepreneur to set goals, anticipate problems, set measures for success, and keep the business on track after starting it.
- A business plan forces the entrepreneur to be realistic about the business's prospects. Sometimes the most successful outcome of a business plan is a decision not to proceed.

## **Business case**

- A document that justifies the investment of internal, organizational resources in a specific application or project.
- A business case for a large, resource-intensive EC project resembles a business plan. For a small or medium-size project, the business case can be much simpler.
- A business plan also is important for a new venture as a tool to recruit senior management and to convince business partners to make a commitment to the business.
- A business plan helps ensure a flourishing business by encouraging an entrepreneur to set goals, anticipate problems, set measures for success, and keep the business on track after starting it.
- A business plan forces the entrepreneur to be realistic about the business's prospects. Sometimes the most successful outcome of a business plan is a decision not to proceed.
- A document that justifies the investment of internal, organizational resources in a specific application or project.
- A business case for a large, resource-intensive EC project resembles a business plan. For a small or medium-size project, the business case can be much simpler.

## The Major Advantages of Business Case

Business cases develop a systematic financial justification for projects; they assist in organizing and not forgetting all the necessary data; they point to drawbacks, constraints and risks; assist in collaboration with relevant partners, and help determine who needs a business case and how to use one. The business case structure is assisted by templates.

## The Cost-Benefit Elements of a Business Case

## **Components of business Case**

- Goals. Begin with a specific description of what the business intends to achieve through the initiative increased sales, reinforcement of the brand or corporate image, improved customer support, reduction in communications and marketing costs, and so forth.
- A useful approach is to define the problem, propose a solution, and describe the expected outcomes or impacts. Conclude this section with goals-one or more statements that briefly describe a desired future condition toward which the business will direct its efforts. Here, it will be advantageous to use a business model.
- Cost savings. If one or more goals include reduction of existing expenditures, then calculate the following: (1) an itemized and quantified list of existing costs that the project will affect and (2) the estimated levels of savings that the project will generate (e.g., reduce long-distance telephone costs by 45 percent).
- Multiply the costs by the saving levels to find the expected reduction of expenditures. You should estimate these savings for a short term time frame, perhaps the first 3 years of the project's operation.
- New revenue. If one or more of the goals suggests an increased revenue stream, then calculate (1) an itemized and quantified list of existing net income (revenue from sales minus cost of sales) the application or project will affect and (2) the estimated levels of new sales that you expect (e.g., increase product sales by 12%). When you multiply the net income by the increased sales levels, you get the expected amount of increased revenue. Do this for the same multiyear time frame as used in the cost-savings calculation.
- Extra benefits. List and, if possible, quantify any additional fiscal benefits that are associated with the project (e.g., improved staff productivity, faster collection of out standing debts). If these are difficult to estimate, it is best to list them but neither quantify them nor add them to the benefits identified previously. This approach will produce an overall more conservative estimate of benefits, building in an extra cushion for project success in the event that the business does not realize all quantified benefits.
- Cost of the solution. This is an itemized and quantified list of costs associated with the online project. You should estimate both direct costs (e.g., amortized costs of website development and website hosting) and indirect costs (e.g. Staff training) for the period.

## Funding a New Online Business:

- Launching an online business can be expensive. The entrepreneur is expected to invest personal funds from savings, personal lines of credit, or taking a second mortgage on his or her house, but these sources of "bootstrap funding" may not sufficient.
- Entrepreneurs should "bootstrap" as long as possible, before tapping into the venture capital market. If the new venture involves a significant risk, traditional sources of debt financing, such as a bank loan, can be difficult or impossible to obtain.

#### First Round of Initial Funding: Angel Investors and Incubators

- When the entrepreneur's personal funds are insufficient, the entrepreneur will go to friends, family members, or to angel investors. An angel investor is a wealthy individual who contributes personal funds and possibly expertise at the earliest stage of business development. Angel investors can be found through organizations such as the Angel Capital Association (angelcapitalassociation.org) and newspapers, magazines, and business-oriented social networks (e.g., LinkedIn).
- An angel investor may provide the developer with an office, hardware, software, salary, and access to human and financial resources.
- In most cases, the angel investor also provides guidance or access to management expertise. In addition to sometimes altruistic goals, the angel investor is looking for a reasonable return on the investment.
- An angel investor is an excellent source of funding for the entrepreneur; however, angel funding is scarce and difficult to find.

- An incubator is a company, university, or nonprofit organization that supports promising businesses in their initial stages of development.
- Although some incubators offer start-up funding, the primary purpose of most incubators is to offer a variety of support services-office space, accounting services, group purchasing, reception services, coaching, and information technology consulting-at little or no cost. In return, the incubator receives a modest fee, equity in the company, or both.

## Second Round Financing: Venture

- Capital One major source of funding new ventures is venture capital. Venture capital (VC) is money invested in a business by an individual, a group of individuals (venture capitalists), or a funding company in exchange for equity in the business.
- The downside for the startup business to acquire VC is minimal; it loses some control over the business in return for funds it is unlikely to acquire from any other source.
- The more difficult problem is finding VC. Due to the many dot-com failures since 2000, many VC sources have disappeared, and competition for venture capital is fierce. However, currently there is a flow in VC financing social media and social commerce companies.
- Some well-known VC companies are vFinance, Inc. (vfinance.com Westlake Securities (westlakesecurities.com), and Garage Technology Ventures(garage.com).

# Additional Funding: A Large Partner

As part of a VC investment or after the reduction of VC money, one or more large companies may step into the process. For example, Yahoo!, IBM, Microsoft, Motorola, Google, Time Warner News Corp., and Oracle have invested in hundreds of EC start- up companies. Eventually, they may acquire the start-up completely. Such investments are frequently done in complementary or competing areas. For example, Yahoo! is a major investor in Google and in Baidu in China; News Corp. acquired the start-up MySpace; and Google invested in dozens of companies related to advertising, including the purchase of YouTube in 2006.

**The Initial Public Offer (IPO)** Once the company is well known and successful, it will go to a stock exchange to raise money via an initial public offer (IPO). In such offerings, investors will pay a much larger amount of money per share than that paid by the initial and secondary funding source, sometimes 5 or 10 times more per share.

## Crowdfunding

A new approach to the financing of startups and small businesses is crowdfunding Crowdfunding, also known as crowd financing, is based on using investors to fund startups. Each individual invests a small amount of money; the collection channels are Internet-based social networks

# **CLASSIFICATION OF WEB SITES**

- Informational Web site A Web site that does little more than provide information about the business and its products and services. The major purpose is to have a presence on the Web.
- Interactive Web site A Web site that provides opportunities for the customers and the business to communicate and share information.
- At a higher level of interactivity are attractors-Web site features that attract and interact with site visitors. Attractors such as games, puzzles, prize giveaways, contests, and electronic postcards (e-cards) encourage customers to find the Web site, visit again, and recommend the site to their friends.
- A transactional Web site sells products and services. These Web sites typically include information and interactivity features but also have sell-side features, such as a shopping cart, a product catalog, a customer-personalized account, a shipping calculator, and the ability to accept credit cards to complete the sale.

- A collaborative Web site is a site that allows business partners to collaborate (i.e., it includes many supportive tools. B2B exchanges may also provide collaboration capabilities.
- A social-oriented website is a site that provides users with online tools for communication and sharing information on common interests. It empowers consumers to utilize their time around the converged media experience for social participation. Social-oriented websites like Facebook have emerged as one of the most powerful marketing channels.

## The process of building a website:

Select a Web host. One of the first decisions that an online business will face is where to place its website on the Internet. The website may be included in a virtual shopping mall, such as 3d-berlin.com, thevirtualmall.com, or pointshop.com/mall.

Alternatively, a web store can be hosted in a marketplace that is a collection of independent web stores like Yahoo! (smallbusiness.yahoo.com), Amazon.com, Etsy, or eBay However, many medium and large-sized businesses build their own websites with either an independent hosting service or through self-hosting arrangements.

- Register a domain name. In a mall or web store, the business's name may be an extension of the host's name. A stand-alone website will need its own domain name, and decisions will have to be made about which top-level domain name to use and whether the domain name includes the business name or only some aspect of branding. Registering domain names is essential to a business.
- Create and manage content. The website also needs content the text, catalog, images, sound, and video that delivers the information that visitors need and expect. Content can come from a variety of sources, but getting the right content in place, making it easy for viewers to find, delivering it effectively, and managing the content so it remains accurate and up-to-date are critical success factors.
- Design the website. This important task is design the web site. Stores in a mall or those using store builders may have limited options, but the stand-alone websites have many options.
- Construct the website and test. Businesses must also decide whether to design and construct the website internally, contract it out to a Web design firm, or a combination of both. When the business owners are satisfied with the website, it is transferred to the website host. At this point, the website is open for business, but it requires final testing to ensure that all the links work and that the processes function as expected (e.g., acceptance of credit cards).
- Market and promote the website. At this stage, the business promotes the location of the website, both online and offline. A business can use any of (one line or offline) the advertising strategies.

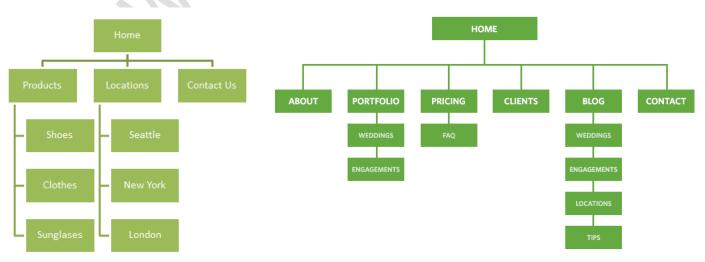

Fig: Basic Hierarchical website structure

White Space	Footer	

#### Website design,

- Web design includes information architecture, navigation design, use of colors and graphics, and maximizing site performance. The purpose of this section is to enable users to understand and possibly contribute to the design of a website when working with Web designers.
- Successful website design is about meeting the customers' expectations and enabling the selling of the products or services. Design starts with identifying the customer's needs, expectations, and problems. A site is then designed to meet those needs and expectations.

## Information Architecture for a Website

- A website's information architecture describes how a site is organized. It lists all the components of a site and how they are connected together. The most common site structure is Most hierarchical websites are built with wide and shallow structures, putting 3-10 components in level II (see above figure) and limiting the components in most other levels.
- Other, less frequently used structures are circular and linear. A circular structure is useful for presenting training materials. A linear structure is useful for tutorials. A website typically includes a homepage that welcomes visitors and introduces the site; help pages that assist the visitor in using or navigating through the site; company pages that give the visitor information about the e-business; transaction pages that lead the customer through the purchase process; and content pages that deliver information about products, services, and related topics.

#### **Site Navigation**

The purpose of site navigation is to help visitors quickly and easily find the information they need on a website. Among the questions considered in the creation of site navigation are: How will visitors access a site? How will visitors use the site? How will they find what is available at the site? How will they go from one page to another and from one topic to another? How will visitors find what they are looking

for? Site navigation has to help visitors find information efficiently, because visitors do not want to take the time to figure out how to access a site.

## Performance (Speed)

Speed is a major design success factor. Visitors who have to wait more than a few seconds for a Web page to load might leave the site. A number of factors affect the page speed, some of which are out of the control of the Web designer (e.g., the visitor's modem speed). The factors that are under the control of the Web designer relate to the content and design of the page. For example, videos and large images should be minimized.

## Usability

Usability refers to how well users can learn and use a product to achieve their goals. It also refers to how satisfied users with that process. Usability measures the quality of a user's experience when interacting with a product or system, including: Websites, Software applications, Mobile technologies, Any user-operated device.

## Usability factors include:

- > Intuitive design: a nearly effortless understanding of the architecture and navigation of the site
- Ease of learning: how fast a user who has never seen the user interface before can accomplish basic tasks
- > Efficiency of use: how fast an experienced user can accomplish tasks
- > Memorability: after visiting the site, if a user can remember enough to use it effectively in future visits
- Error frequency and severity: how often users make errors while using the system, how serious the errors are, and how users recover from the errors
- Subjective satisfaction: if the user likes using the system

## **Colors and Graphics**

Rich media that includes colors, images, sound, and videos can improve the attractiveness of websites. Therefore, designers try to find what visitors like in rich media and give it to them. For example, dashboards need to use multiple colors, and so do maps and videos.

#### Web content creation and management:

Web content is content (the text, images, sound, and video) that is included on a Web page. Creating and managing content is critical to web-site success because it presents the company and king!". nd its products to customers. In Web design, "Content is

## Categories and Types of Content

- Providing content to EC sites may be a complex job due to the variety and quantity of the contributing sources.
- In addition, content may include foreign languages and must be updated frequently. Content may include all types of media. Finally, content may involve security, quality, privacy protection, and permission issues.
- Frequently changing content (e.g., weather news) is referred to as dynamic Web content, which is constant and may updated infrequently (standard HTML pages) as distinguished from static Web content.
- Up-to-the-minute dynamic content is what attracts new and returning customers ("eyeballs") and makes them stay longer ("stickiness"). Therefore, dynamic Web content contributes to customer loyalty.

#### Web content creation and management:

#### **Primary and Secondary Content**

Content should include more than just information about the product itself (the primary content). A website also should include secondary content that offers marketing opportunities, such as the following:

**Cross-selling.** Using content for cross-selling means offering complementary or related products and services to increase sales. Amazon.com offers people who read personalized recommendations such as "customers who bought this book also bought..." and items "frequently bought together."

**Up-selling.** Creating content for up-selling means offering an upgraded version of the product in order to boost sales and profit. Amazon.com offers "great buy" book combinations (buy two related books for slightly more than the price of one). (It also practices down-selling by offering visitors used copies of a book at a cheaper price than the new book.) Up-selling activities usually include offering products with a different design, color, fabric, or size.

**Promotions.** A coupon, rebate, discount, or special service is secondary content that can increase sales or improve customer service. Amazon.com frequently offers reduced or free shipping charges, (e.g, to Prime members or with a purchase of \$35 or more).

**Comments.** Reviews, testimonials, recommendations, or 'how to use the product' supplement content. Amazon.com book pages always have editorial and customer reviews of the book, and the "look inside this book" feature sometimes allows website visitors to pre view some book chapters.

**Content management** is the process of collecting, publishing, revising, updating, and removing content from a website to keep content fresh, accurate, compelling, and credible.

Almost all sites begin with a high level of relevant content, but over time material becomes dated, irrelevant, or incorrect. Content management makes sure a site remains relevant and accurate long after it was placed on the site.

#### **Content Management Software (System)**

Content management software enables nontechnical contributors to create, edit, and/ delete content on a company's website. This way, companies empower and induce content owners to manage their own content. There are numerous software packages available on the market that help with content management.

#### **Catalog Content and Its Management:**

- An electronic catalog is a supplement, or in some cases, a replacement for the traditional printed catalog where buyers can view a company's entire product line, e-catalog websites do not have live shopping features.
- Typically, manufacturers, importers and wholesalers are the type of businesses that can maximize the usage of an e-catalog. Once the buyers are interested in the products, they would use a contact form to express their interest to the company.
- Customers can fill out a form on your website and you will then process the order offline. An e-catalog website allows you to showcase your products online with the option of hiding or revealing the price of the item. You can choose to display the features, specs, pictures, and even downloadable forms if needed.
- Much of the content in B2B and B2C sites is catalog based. Although there are many positive aspects of e-catalogs, poorly organized ones may deter buyers. Companies need to make sure that their catalog content is well created and managed.
- For B2B internal catalog creators, who aggregate suppliers' catalogs on their own websites, content management begins by interacting with suppliers and then collecting their relevant content. That is no

small task, considering that most large buying organizations have hundreds, or even thousands, of suppliers, each of which may use different data formats and terminology to describe their catalog items.

### Website promotion

Website promotion through advertising (e.g., banner ads, pop-up ads) and marketing strategies (e.g., banner swapping, use of video ads, use of blogs, chat rooms, or groups in social networks and virtual worlds). This section focuses internal website promotion, i.e., conducting marketing on communications on the site itself.

## **Internal Website Promotion**

- Internal website promotion begins by including content to attract customers so that they will return and refer others to the site. To do this, the website needs compelling content, useful links to other websites, and features that will make customers want to return (e.g., provide entertainment). The results derived from Web analytics are used to plan promotions and ads.
- Web analytics is the measurement, collection, analysis and reporting of web data for purposes of understanding and optimizing web usage.

## Search Engine Optimization (SEO)

Search engines are a good mechanism for most people to find information, and therefore, a good platform for online advertising. Placing online ads on Web pages that show results from querying a search engine is known as search advertising.

If the search result includes your company and product, it is a free advertisement for you. The problem is that the results of a search may include thousands of items, and your product may be not on the first or second page of the results. Note that, search advertising includes mobile search and social network search. Two major forms of search engine advertising are keyword advertising and URL listing.

## **Keyword Advertising**

- Keyword advertising links the appearance of ads with keywords specified by the advertiser. It includes "pay per click." Businesses select the keywords to which they want their advertisements to be searched and matched.
- Advertisements appear on the screen along with the search results when the chosen keywords are searched. This can substantially increase the likelihood that the advertisement will be viewed and possibly acted on because of its high relevance to user interests.

#### **URL Listing**

- Most search engine companies allow businesses to submit their URLS for free, so that these URLs can be searched for by the search engines. Search engine spiders crawl through each site, indexing its content and links. The site is then included as a candidate for future searches. Because there are quite a few search engines, advertisers who use this method should register their URL with as many proper search engines as possible.
- In some cases, URLS may be searched even if they are not submitted to the search engines. The major advantage of URL listing is that the listing can be very relevant to the subject of the search. This is the key to Google's success, as we will describe later.
- The second major advantage of using a search engine as an advertising tool is that it is free. Anyone can submit a URL to a search engine and be listed. People searching for a certain product will receive a list of sites that mention the products. However, the URL method has several drawbacks.
- The major one is that it is difficult (or expensive) to get your ad to appear in a good location on the list generated by the search engine. Search engines find a very large number of related Web pages for each inquiry made by a user. The chance that a specific company's site will be found and included at the top of a search engine's display list (say, in the first 10 items) is very slim. Hence, many companies provide a service to help advertisers improve the location (usually targeting the first page) of the search result. This is called search engine optimization.

#### Search Engine Optimization (SEO)

- Search engine optimization (SEO) is a process that improves the visibility of a company or brands on the results page displayed by a search engine. Ideally, the results should be in the top five to ten on the first page. Companies hire search optimizers or try to optimize by themselves. SEO can increase the number of visitors to a website, and therefore companies are willing to pay for this service.
- SEO is performed in all types of online searches, including video search, social network search, and image search. According to Google AdWords, "to get your ads to appear when people search for your product or service, the keywords you choose need to match the words or phrases that people use, or should be related to the content of the websites your customers visit"

## Sponsored Ads (Paid Inclusion)

In addition to optimizing your Web pages so that they will appear on the first page of the search results, you can buy keyword ads to appear on the first page of the results. This is referred to as paid inclusion or sponsored ads. Your ads will show up on the first page of the results, at the top of the page or on the

right side based on/ the amount you decide to spend. Google uses auctions (first page bids) to sell the best locations to advertisers.

## Website hosting and obtaining a domain name:

- Web hosting is a service that allows organizations and individuals to post a website or web page onto the Internet. A web host, or web hosting service provider, is a business that provides the technologies and services needed for the website or webpage to be viewed in the Internet.
- Websites are hosted, or stored, on special computers called servers. When Internet users want to view your website, all they need to do is type your website address or domain into their browser. Their computer will then connect to your server and your webpages will be delivered to them through the browser.

#### **The Domain Name**

Domain names provide the address of the server so that when people type in your domain name they will be taken straight to your rented space. Where the data that makes up the web-page is stored. This process is known as "delegation" this is when the domain name points to your direct hosting account on the server The Servers job is to "Serve" the files to the browser that made the.

## Selecting and Registering

A Domain Name A domain name is a name-based Internet address (owned by a person or an organization) that identifies a specific website and its Internet- connected server. It is an "online identity," which allows users to identify one or more IP addresses. Most domain names are assigned by an agency called Domain Name Systems, or DNS. Usually, a domain name is designated by the portion of the address that comes right before the ".com" or ". org" (or other top level designation), and it includes the ".com" or ".org" portion.

#### The short steps to register a domain name are:

- 1. Choose a reliable domain registrar (like Hostinger, ipage).
- 2. Find a domain availability checker tool.
- 3. Run a domain name search. 4. Pick the best available option.
- 5. Finalize your order and complete the domain registration.

6 Verify the ownership of your new domain.

Note: np domain free, you can create your own domain from mercantile company.

## Web Hosting Options:

- A store builder service (also called 1 a design-and-host service) provides Web hosting as well as storage space, templates, and other services to help small businesses build a website expeditiously and inexpensively.
- An example of a company that offers comprehensive store building smallbusiness.yahoo.com/webhosting). Is Yahoo! Services?
- However, using a store building service has certain disadvantages, one being the lack of certain functionalities (eg, accepting payments through PayPal may not be possible).

## A Dedicated Hosting Service

A Web hosting service is a type of hosting service that allows individuals and organizations to make their website accessible on the Web (providing websites with space on the Internet).

Companies such as Go Daddy, iPage, Shopify, Web.com, and BlueHost offer more and better services than a storebuilder service offers. Almost all Web hosting companies also have internal Web design departments to help the clients. In addition, features such as shipping, tax calculators, and comprehensive site statistics are likely to be available.

### Web Hosting Options:

### Self-Hosting

- With self-hosting, a company is doing the job in-house (build your own website and host themselves). For this purpose, it needs hardware, software, IT staff, and dedicated telecommunications services.
- Self-hosting is beneficial when a business has special requirements, or a large and complex site. Some of the disadvantages of self-hosting are the high cost and the low speed of construction. The other Web hosting options enable the hosting company to share the costs of site hosting among many of their customers.

#### **Free Web Hosting Services**

Several companies offer free web hosting, but they do not offer the many features offered by the dedicated web hosting companies. For example 000WebHost.com, InfinityFree.net, Sites.Google.com, FreeHosting.com etc.

#### cPanel management, upload EC site to the web Server

- CPanel is the web hosting control panel, or software that facilitates the management of a web hosting server, developed by cPanel, L.L.C., an American corporation. The software provides a graphical interface (GUI) and automation tools designed to simplify the process of hosting a web site to the website owner or the "end user".
- cPanel is part of a software suite called cPanel & WHM(Web Host Manage) which provides capabilities for administrators, resellers, and end-user website owners to control the various aspects of website and server administration through a standard web browser using a three-tier structure. While cPanel is limited to managing a single hosting account, cPanel & WHM allows the administration of the entire server.
- CPanel is an online Linux-based graphical interface (GUI) used as a control panel to simplify website and server management. cPanel allows you to publish websites, manage domains, organize web files, create email accounts and more.

#### Common tasks perform by cpanel:

- Connect domain names to your hosting
- Set up emails for your site
- Install WordPress (or another content management system)
- Back up your website
- Upload files to your server
- Create sub-domain
- Check your bandwidth and other usage stats
- Change various security settings Install add-on apps on your server
- Create new databases / manage existing ones
- Set up various optimizations

### How to Upload Your Website

- Pick a Reliable Web Hosting Company.
- > Choose Your Website Upload Method. File Manager. File Transfer Protocol (FTP)
- > Upload Your Website File. Using File Manager or Using FileZilla.
- Move the Website Files to the Main Root Directory.
- Import Your Database.
- Check If the Website Works.

### Implementation of payment system in web site

1. Log in to your PayPal account, or register a new account if you do not already have one.

Click on "Merchant Services" on the horizontal navigation bar near the top of the page. On the Merchant Services page, click on "Create payment buttons for your website." If you need a more advanced service than just payment buttons, you can call PayPal for assistance using the phone number on the right side of the page.
Follow the three steps on the button creation page. The first step requires you to choose a button type, such as "Pay Now" or "Donate," and then enter the payment détails. Steps two and three offer additional, optional functionality.

4. Click the "Create Button" button at the bottom of the page after you finish entering the information. PayPal will provide you with a string of HTML code to place on your Web page wherever you want the button to appear. For more help, click on the "Integration tips" just above the HTML string.

5. Paste the HTML into your website wherever you want the button to appear. Update your website by using your Web host's tools or by manually uploading the updated Web pages to your server.

6. Test the new buttons yourself by making sure they work properly. You usually won't need to complete an entire transaction; simply click on the button and ensure that it takes you to a payment page on PayPal's own secure servers. Look for the "paypal.com" domain in your browser's address bar.

# Questions

- 1. Describe the website design criteria that one should show while designing an e-commerce website.
- 2. How important web contents are for e-commerce systems? Discuss their types. Justify, with examples, how web Contents can be used to promote cross-selling, up-selling and promotions in e-commerce.
- 3. What is Business case and what are components of business case.
- 4. Explain Classification of websites.
- 5. Write about the process of building a website.
- 6. Basic hierarchical website structure.
- 7. Describe about Webpage Layout.
- 8. What are the process of building website?

#### The End
